Instruction:
Your team needs to evaluate and address issues with the current system, or create a new system using the software development life-cycle methodology, based on the **Etiqa Digital Payout (via eMoney) scenario description in Accelerating Customer Disbursements and Reinforcement of Financial Inclusion**. This will involve engaging in core activities of Requirements Engineering, such as eliciting, documenting, negotiating, prioritizing, and managing requirements, as well as producing high-quality software artifacts, including requirements specifications, models, and prototypes.

To complete the project, your team has to perform the specified tasks as follows:

RE activities	Guidelines	Deliverables	Due date	Marks
Elicitation	• Read and identify the existing requirements (i.e. functional, quality and constraints types) and system context objects (i.e. people, business processes, system in operation, external software, external hardware, events, documents, rules / standards) of *As-Is* system (Topic 1 & 2) • Gather or elicit requirements from the main sources in the system and its context (i.e. stakeholders, documentations, systems in operation) • Perform suitable elicitation techniques to gather the requirements from the identified sources o Stakeholders - Interview, survey/questionnaires, workshop/brainstorming o Documents - system archaeology, perspective-based reading, mind-maps o Systems in operation - field observation, apprenticing, prototyping • Analyse the stakeholders intention towards system property (functional, quality) and development project (constraints) o Draw Goal model to represent the high-level (strategic concerns) and low-level objectives (technical, security, sustainability, and intelligent software elements) • Analyse the flow of business processes that cross-functional with the related stakeholders for *As-Is* system. o Draw Swimlane diagram for each business process of *As-Is* system.	**1. Phase 1 (PR1) Report: *User Requirement Document (URD)*** – Goal model & business process flow model (using horizontal Swimlane diagram) **2. Video presentation - Guidelines:** Each team will produce a 5–7 minute video presentation. The presentation must clearly demonstrate: i. Overview of the system context – Describe the problem domain, stakeholders, and scope of the system. ii. Elicitation summary – Explain the methods used to gather requirements (e.g., interview, document analysis, observation). iii. Goal Model explanation – Describe the strategic and operational goals, including	**Week 9 6/12/2025**	**4.5%** **4.5%**

RE activities	Guidelines	Deliverables	Due date	Marks
	• Analyse the unsolved-problems and issues faced by the end-users of *As-Is* system. • Suggest the improvement processes for the analysed problems/issues • Draw Swimlane diagram for each improvised business process of *To-Be* system. • Specify all related business rules to the proposed process for *To-Be* system.	any *security*, *AI*, or *sustainability* elements. iv. Business Process (As-Is / To-Be) – Walk through the *horizontal swimlane diagram* and explain stakeholder roles and process flow. v. Reflection – Briefly discuss challenges faced and lessons learned during the elicitation and modeling process. A window box with the speaking presenter via a camera should be configured as shown the example below during recording **3. Leadership:** using MyPeer app, rate team members and give feedback based leadership and teamworking.		**3%**

RE activities	Guidelines	Deliverables	Due date	Marks
Documentation	• Model the analysis results of elicited user requirements (***continuation from PR1 report***) based on 3 perspectives: ○ Structural & Data – UML Domain Class diagram ○ Functional & Flow– UML Use case and Activity diagrams ○ State & Behavioral – UML State and Sequence diagrams	**1. Project 2 (PR2) Report: Requirement models document**– UML Use Case model, UC specifications, UML activity, UML domain class, UML state diagrams **2. Video presentation** - Create a 5–7 minute video presentation that demonstrates comprehension of the three modeling perspectives: 1. Structural & Data View: Explain the UML Domain Class Diagram and how it reflects relationships and key entities from the system. 2. Functional & Flow View: Present the Use Case Diagram and Activity Diagram, describing interactions among stakeholders and process flows. 3. State & Behavioral View: Discuss the State Machine and Sequence Diagrams, explaining dynamic behaviors of critical components. -The presentation should highlight: • Consistency and traceability from	**Week 11** **20/12/2025**	**5%** **5%**

RE activities	Guidelines	Deliverables	Due date	Marks
		PR1 goals and requirements. • Justification for the chosen UML models and design decisions. • Clarity of collaboration among team members in model development. **3. Leadership:** using MyPeer app, rate team members and give feedback based leadership and teamworking.		**3%**
	• Prepare the software requirements specification (SRS) document ***(continuation from PR2 report)*** ○ Specify the elicited requirements statements according to good quality criteria ○ Follow guidelines and standard for document structure using IEEE template	**1. Project 3 (PR3) Report:** ***Software Requirement Specification (SRS) document*** **2. Video presentation** -Produce a **5–7 minute presentation** focusing on the structure, content, and clarity of the **SRS document**. -The video should explain: i. **Overview of the SRS structure** – Sections, standards (IEEE 830/29148), and purpose. ii. **Functional requirements** – Key user requirements and how they relate to the modeled system behavior. iii. **Non-functional requirements** – Security, AI integration,	**Week 13** **03/01/2026**	**5.5%** **5.5%**
Validation & Negotiation	• Check the produced SRS document. Validate the document contents in terms of its structures and quality criteria • Conform with the prospect stakeholder, negotiate if necessary			
Management	• Manage the produced SRS document in terms of ○ Traceability information ○ Versioning, log histories ○ Change request			

RE activities	Guidelines	Deliverables	Due date	Marks
		sustainability, and quality attributes. iv. **Traceability** – Show how requirements align with PR2 models (Use Case, Class, Sequence, etc.). v. **Reflection** – Lessons learned on improving requirement specification quality and team documentation practices. **3. Leadership:** using MyPeer app, rate team members and give feedback based leadership and teamworking.		**3%**
	• Develop high fidelity mock-up prototype for ***To-Be*** system that conforms with the results of analysis and findings in previous PR1, PR2 and PR3 reports • To mock-up the prototype, choose appropriate use cases in PR3 that **complex enough** and assign individually each use case to specific team members • During realization of use case scenarios in the mockup, if any change on scenarios of use cases flows (normal, alternative and exception) in PR3 findings are found, revise the current SRS document.	***1.*** **Alternative Assessment: *High fidelity mock-up Prototype*** (share prototype resource file, video presentation for prototype demo and revised SRS document.	**Week 15**	**40%**
