Further explanation of the Type of Defect

C - Critical:

- **Definition:** The defect prevents the system from achieving its goal or violates a core business requirement.
- *Example:* The Use Case does not achieve the stated objective; a security step is completely missing; the post-condition does not leave the system in a stable state.

MJ - Major:

- **Definition:** Significant logic errors or missing information that would confuse a developer or tester.
- *Example:* Missing alternative paths (branches); steps are out of order; ambiguous logic (e.g., "System checks data" without saying *what* data).

MN - Minor:

- **Definition:** Small issues that do not break the logic but affect readability or professionalism.
- *Example:* Spelling/grammar errors; inconsistent naming (e.g., "User" vs. "Customer"); formatting issues.

G - Good:

- **Definition:** Highlights a well-written section to encourage best practices.
- *Example:* "The complexity of this logic was handled very clearly."
