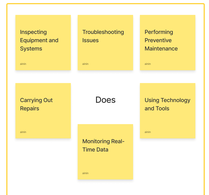
Empathy Map

Quotes What do they say or need to say to others?



Actions What do they do to get the job done?

Expectations What do they think about the situation?

Values How does this person feel about things?

Persona

BACKGROUND

Age: 34 years old, Marcus is a senior mechanical engineer with over 10 years of experience working on offshore platforms. He spends 90% of his 12-hour shifts physically inspecting equipment, from massive compressor pumps in harsh weather conditions. He takes pride in his ability to fix complex machinery, but the job is physically demanding and can lead to physical exhaustion. He is required to wear full Personal Protective Equipment (PPE), including thick industrial safety gloves, at all times. He is not "anti-tech," but he gets frustrated when technology gets in the way of his work. He'd rather stop his physical work to tap on a small screen.

MOTIVATIONS

Marcus is deeply motivated by the safety of his crew; he knows that a missed inspection could lead to a catastrophic failure. He's driven by efficient—finishing his rounds quickly means less time exposed to dangerous zones. He values tools that work with him, acting as a "second pair of eyes" rather than a distraction that demands his full attention.

CONCERNS

He constantly worries about missing subtle signs of equipment failure because he doesn't have the right data in front of him at the moment of inspection. He's concerned that checking manuals on a laptop breaks his focus, potentially leading to mistakes. He also fears that "information overload" from generic dashboards will hide critical warnings until it is too late

CHALLENGES

His primary challenge is physical interaction; he cannot easily use keyboards, mice, or standard touchscreens while wearing his safety gloves. He struggles to get a clear, stable signal for communication, and he frequently has to walk back to the control room just to verify a schematic, which creates a major bottleneck in his workflow.

GOALS

To verify real-time sensor data (pressure, vibration, temperature) hands-free without interrupting his repair work.

To access specific equipment schematics directly in his line of sight using Augmented Reality.

To reduce the time spent travelling between the field and the control room for simple data checks.

SCENARIO

Marcus is dispatched to Zone 4 to investigate a vibration alarm on a critical pump. His hands are covered in grease, and he's wearing thick gloves. Instead of stopping to clean up and open a laptop, he activates his AR Smart Helmet. He looks at the pump and says, "Show me the last Diagnostics," and the Digital Twin system immediately overlays a holographic vibration graph over the physical machine. He identifies a misalignment instantly, pulls up the repair guide, and finishes the job in 20 minutes—all without ever taking his gloves off or looking away from the equipment.

Persona

Sarah Jenkins

ARCHETYPE — The Rig Supervisor

BACKGROUND — Age: 45. Sarah is the manager in the main control room. She sits at a desk with many big screens showing the rig's overall status and the safety of all 50 workers on the rig. Her job is very stressful because if something goes wrong, she is responsible for the safety of all those workers. She is smart, but she gets a headache looking at thousands of numbers all day.

MOTIVATIONS — She wants to keep her crew safe. She needs to know exactly what is happening in every part of the rig. Most of all, she wants a system that tells her "Everything is Okay" or "Stop the Machine" without confusing details.

CONCERNS — She is scared that she will miss a real emergency because there are too many small, confusing alerts popping up on her screen. If a tool she doesn't use the warning in time, someone could get hurt.

CHALLENGES — Her main problem is too much data. The current system is overwhelming. It shows her hundreds of numbers and charts. When an alarm goes off, she has to waste time searching for where the problem is instead of acting immediately.

GOALS — To have a simple dashboard that only shows the most important updates.

To see big, clear warnings (Red for Danger) so she can react fast.

To instantly see where the problem is on a map of the rig.

SCENARIO — A loud alarm starts ringing during a storm. Sarah looks at her screen and sees a red light. She doesn't know which one is real. But with the new Supervisor Dashboard, she sees just one big Red Alert: "Zone B Pressure High." The system hides the small details. She immediately knows exactly where to send her team and tells the crew to leave that area. She saves time and keeps everyone safe.

Persona

Alisha Rahman

ARCHETYPE — The Learning Trainee

BACKGROUND — Age: 23. Alisha is a new trainee on the oil rig. She spends his days shadowing senior crew members and joining safety drills. The environment is noisy, fast-paced, and physically demanding. She is still adjusting to the workflow and expectations.

MOTIVATIONS — She wants to learn safety protocols confidently. She hopes to understand the equipment well enough to work independently. She aims to prove herself as a reliable team member. She prefers clear, simple instructions that help her keep up.

CONCERNS — Alisha worries about making dangerous mistakes due to her lack of experience. She and whether she's learning fast enough. She gets overwhelmed by all the information and procedures. She fears disappointing the experienced workers.

CHALLENGES — The job involves long hours and tough conditions she's still adapting to. Equipment interfaces and dashboards feel complex to her. She gets nervous handling machinery. She sometimes struggles with asking questions, and seeking support.

GOALS — To understand tasks through step-by-step guidance.
To become confident without constant supervision.
To adapt to the rig environment and improve his skills.
To reduce stress by having clearer support tools.

SCENARIO — Alisha is asked to help inspect equipment. Normally, she pauses often and double-checks instructions. With the AR Smart Helmet, clear visual guidance helps her. She completes the task correctly, gains confidence, and feels more prepared for future work.
