Question 21

Not yet answered

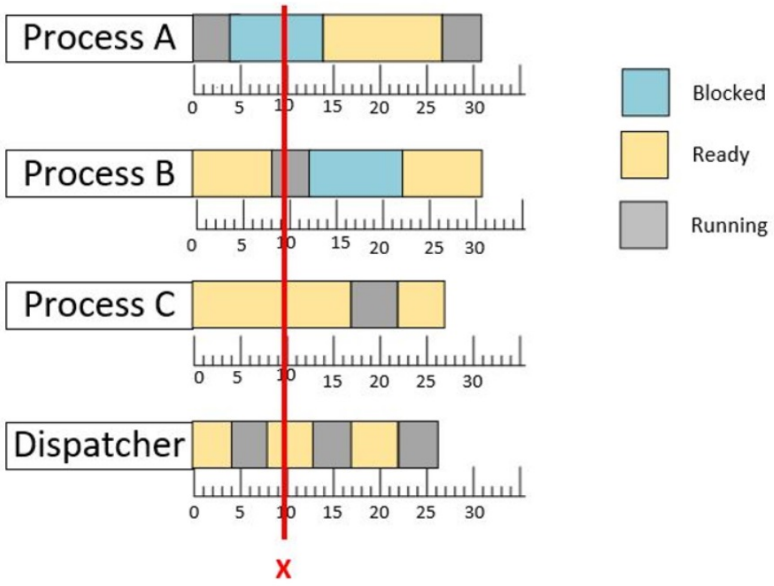

Marked out of 8.00

-

Refer to the process state as illustrated in the following figure and answer the following questions for the concurrent process execution in a single processor system.

Process	Address
Process A	3000-3012
Process B	7000-7050
Process C	5000-5010

The dispatch latency of a dispatcher is set to be 4 instruction cycles. At instruction cycle of 3, process A requested an I/O device and waits up to 10 instruction cycles. Then, process B got interrupted at instruction cycle of 12 and going into halt until the instruction cycle of 22. The maximum CPU burst for each process is set to be 5 instruction cycles.

1. When is the Process A enters the Ready state? *= instruction cycle of*

13

2. At what instruction cycle the Process B is executed? *= instruction cycle of*

7

3. At which instruction cycle Process C ends its Ready state? *= instruction cycle of*

15

4. What is the process state for process **B** at **X?** Running state

5. How many more instruction cycles are required to finish the execution of Process **A**?

3
